ANALYTIC STRATEGIES

To Drive Patient-Centered Care

Rising costs and rigorous criteria for value-based reimbursement models can distract from prioritizing patients throughout the care process. Health systems can keep patients at the center of care and balance the financial focus of value-based care with comprehensive, up-to-date data.

Prioritize Patient Outreach by Risk Level

Set targets based on risk stratification to identify high-risk patients, proactively address health concerns, and apply early interventions.

Deploy Data Tools to Combat COVID-19

Leverage data and analytics tools to understand capacity, utilization, and alternative healthcare delivery methods (e.g., telemedicine).

Promote Data Literacy

Develop literacy tools and training to help team members better understand and apply data throughout the care process.
